In terms of the Japan ringback tone 400 Hz modulated by 15 Hz I presume I can simulate that (mostly) but just using 400 ...

Yes, you are exactly right. Mixing **400 Hz** and **415 Hz** simultaneously will create the exact acoustic phenomenon you need.

Because your AD9833 devices cannot do true amplitude modulation (AM), combining those two static frequencies creates a physical interaction called **wave interference** or **acoustic beating**.

How the Math Works
